"""

Scenario registry for the AML Cypher rule engine.

Each entry is a v5-style detection scenario (see docs/new\_v5\_spec/Project-Overwatch-Full-Requirements-Specification.md §15). Thresholds live in DEFAULT\_PARAMS so tuning does not require code edits; rule\_engine.render\_query(scenario, params) injects them into the Cypher string at load time.

GRAPH CONTRACT (see etl/graph\_loader.py + init-scripts/03-graph-schema.sql):

```

Vertex labels : Entity, SuperNode properties: {id, system}
Edge label : Transfer properties: {amount_usd, timestamp, ref_id[, asset]}
`system` is 'FIAT' for fiat rails, or the chain name (e.g. 'ETHEREUM')
for crypto. There is currently NO beneficial-owner / party dimension on
nodes, so cross-rail-same-UBO scenarios are not yet expressible.
```

VERIFICATION CAVEAT: Cypher correctness against a live Apache AGE instance could not be executed in this environment (no Docker/Postgres+AGE). The four migrated rules (CIRCULAR, SMURFING, PEELING, HIGH\_VELOCITY\_LAYERING) are preserved VERBATIM from the prior build and were assumed working. The two new rules (RAPID\_MOVEMENT, RAPID\_LAYERING) follow the same Cypher patterns (incl. the timestamp-subtraction idiom already used by the HIGH\_VELOCITY\_LAYERING rule) but MUST be live-verified before production use – see test\_scenarios.py and the manual verification procedure in Implementation\_Plan/20260710\_typology\_gap\_plan.md.

The 4 migrated rules keep their original ``name`` values so existing alerts ('CIRCULAR\_TRANSACTION', 'SMURFING\_STRUCTURING', 'PEELING\_CHAIN', 'HIGH\_VELOCITY\_LAYERING') remain backward-compatible; the new ``code`` field is the stable v5 scenario identifier.

"""

208 lines · 8.2 KB · page 545

```
"""
Contract tests for the AML scenario registry.

These validate the *structure* of scenarios.py without needing a live
PostgreSQL+Apache AGE instance (which is unavailable in CI without Docker).
They catch the regressions that a silent Cypher typo or a missing field
would cause. For end-to-end (live-fire) verification of the Cypher itself,
see the manual procedure documented in
Implementation_Plan/20260710_typology_gap_plan.md ("Live verification").

Run: python aml_platform/etl/test_scenarios.py
 or: pytest aml_platform/etl/test_scenarios.py

"""
DEPRECATED backward-compat shim.

The scenario registry now lives in ``scenarios.py`` (v5-style entries with
stable ``code`` identifiers and tunable params). ``rule_engine.py`` consumes
the registry directly. This module is kept only so any external code still
doing ``from typologies import TYPOLOGIES`` (or referencing a ``CYPHER_*``
constant) keeps working; it derives everything from the registry so there is
a single source of truth.

New detection scenarios MUST be added to ``scenarios.SCENARIOS`` – do not
edit this file.

```

This is a [Next.js](https://nextjs.org) project bootstrapped with [`create-next-app`](https://nextjs.org/docs/app/api-reference/cli/create-next-app).

### ## Getting Started

First, run the development server:

```
``bash
npm run dev
or
yarn dev
or
pnpm dev
or
bun dev
``
```

Open [http://localhost:3000](http://localhost:3000) with your browser to see the result.

You can start editing the page by modifying `app/page.tsx`. The page auto-updates as you edit the file.

This project uses [`next/font`](https://nextjs.org/docs/app/building-your-application/optimizing/fonts) to automatically optimize and load [Geist](https://vercel.com/font), a new font family for Vercel.

### ## Learn More

To learn more about Next.js, take a look at the following resources:

- [Next.js Documentation](https://nextjs.org/docs) - learn about Next.js features and API.
- [Learn Next.js](https://nextjs.org/learn) - an interactive Next.js tutorial.

You can check out [the Next.js GitHub repository](https://github.com/vercel/next.js) - your feedback and contributions are welcome!

### ## Deploy on Vercel

The easiest way to deploy your Next.js app is to use the [Vercel Platform](https://vercel.com/new?utm\_medium=default-template&filter=next.js&utm\_source=create-next-app&utm\_campaign=create-next-app-readme) from the creators of Next.js.

Check out our [Next.js deployment documentation](https://nextjs.org/docs/app/building-your-application/deploying) for more details.

```
-- =====
-- PHASE 5: ALERT SCHEMA V5 ENRICHMENT (additive)
-- =====
-- Implements Phase 0.1 of Implementation_Plan/20260710_typology_gap_plan.md.
--
-- Adds v5 converged-model columns to the existing `alerts` table so each
-- rule-engine alert records its stable scenario code/category/rail. All
-- columns are NULLable so existing OFAC_MATCH / hand-written alerts keep
-- working unchanged (backward compatible). Idempotent (IF NOT EXISTS).
--
-- NOTE: `alerts` is created (in 01-init.sql) under the active search_path,
-- which these scripts set to ag_catalog first. We mirror that here so the
-- ALTER resolves to the same schema the table lives in.

LOAD 'age';
SET search_path = ag_catalog, "$user", public;

-- Stable v5 scenario identifier (e.g. 'SCN_CIRCULAR_01'). NULL for legacy alerts.
ALTER TABLE alerts ADD COLUMN IF NOT EXISTS scenario_code VARCHAR(50);

-- v5 scenario_category enum (STRUCTURING|LAYERING|PLACEMENT|TRAVEL_RULE_BREACH|
-- BLOCKCHAIN_RISK|UNHOSTED_WALLET|VELOCITY|PEP_MONITORING|CIRCULAR_FLOW|RAPID_MOVEMENT).
ALTER TABLE alerts ADD COLUMN IF NOT EXISTS scenario_category VARCHAR(50);

-- Rail the alert fired on (FIAT|STABLECOIN|BOTH).
ALTER TABLE alerts ADD COLUMN IF NOT EXISTS rail VARCHAR(20);

-- v5 ml_typology label (STRUCTURING|LAYERING|CRYPTO_MIXING|DEFI_LAUNDERING|SANCTIONS_EVASION).
ALTER TABLE alerts ADD COLUMN IF NOT EXISTS ml_typology VARCHAR(50);

-- Detection window bounds (for time-windowed batch scenarios).
ALTER TABLE alerts ADD COLUMN IF NOT EXISTS window_start TIMESTAMP WITH TIME ZONE;
ALTER TABLE alerts ADD COLUMN IF NOT EXISTS window_end TIMESTAMP WITH TIME ZONE;

-- Registry version that produced this alert (scenarios.RULE_VERSION) for audit/drift tracking.
ALTER TABLE alerts ADD COLUMN IF NOT EXISTS rule_version VARCHAR(30);

-- Lookup indexes for the analyst queue (filter by scenario / category / status).
CREATE INDEX IF NOT EXISTS idx_alerts_scenario_code ON alerts(scenario_code);
CREATE INDEX IF NOT EXISTS idx_alerts_category ON alerts(scenario_category);
CREATE INDEX IF NOT EXISTS idx_alerts_rail ON alerts(rail);
CREATE INDEX IF NOT EXISTS idx_alerts_status_created ON alerts(status, created_at);

COMMENT ON COLUMN alerts.scenario_code IS 'Stable v5 scenario code (nullable for legacy OFAC_MATCH alerts).';
COMMENT ON COLUMN alerts.rule_version IS 'scenarios.RULE_VERSION when the alert was raised.';

-- =====
-- FUTURE (not in this increment – documented as blocked in the plan):
-- The v5 spec's behavioural-baseline scenarios (Velocity, Dormant, Profile
-- Mismatch, Structuring-by-window) require tables that do not yet exist:
-- customer_behaviour_baseline, wallet_behaviour_baseline, party (with
-- expected_txn_profile), account (with account_status). Those tables and
-- the party/UBO graph dimension (needed for SCN_CROSS_RAIL_LAYER_01) are
-- prerequisites for Phases 1.2, 2 and 3 and are tracked in the plan.
-- =====
```

## aml\_platform/init-scripts/06-party-ubo-model.sql

88 lines · 4.7 KB · page 717

```
-- =====
-- PHASE 6: PARTY / UBO DIMENSION (unblocks SCN_CROSS_RAIL_LAYER_01)
-- =====
-- Implements the 1.2 prerequisite from
-- Implementation_Plan/20260710_typology_gap_plan.md §5.2.
--
-- The aml_network graph models instruments (fiat accounts, crypto wallets) as
-- Entity nodes with only {id, system}. To detect Cross-Rail Layering
-- ("stablecoin inflow -> fiat outflow within 48h, SAME beneficial owner") we
-- need a party dimension that links each instrument to the natural/legal
-- person controlling it, and a UBO chain that rolls legal entities up to
-- their ultimate beneficial owners. This script adds that relational
-- dimension and the graph labels the projection (etl/party_loader.py) writes.
--
-- Convention: relational tables are created under the active search_path
-- (ag_catalog first), matching how 01-init.sql created staging_*/alerts.

LOAD 'age';
SET search_path = ag_catalog, "$user", public;

-- party: the natural person or legal entity behind one or more instruments.

## # AML Platform: Networked Fund Flow Specification v2.0

### ## 1. Executive Summary

The AML Platform is a unified investigation tool for analyzing networked fund flows across traditional fiat (SWIFT) and Web3 (On-chain/Crypto) environments. It leverages a hybrid Relational-Graph architecture to detect complex money laundering typologies and provide analysts with interactive visual investigation capabilities.

---

### ## 2. Technical Stack

- **Backend**: Python 3.12+ / FastAPI (Modular N-Tier Architecture)
- **Database**: PostgreSQL 16+ with **Apache AGE** (openCypher extension)
- **Frontend**: Next.js 15 (App Router) + TypeScript
- **Styling**: Tailwind CSS + Shadcn/UI
- **Graph Visualization**: Cytoscape.js with custom layout engines
- **Infrastructure**: Docker Compose (Local Dev) / Kubernetes (Target)

---

### ## 3. Core Functional Requirements

#### ### 3.1 Data Ingestion & Normalization

- **T+1 Batch Processing**: Ingest daily records for Fiat (SWIFT) and Crypto (On-chain).
- **Unified Schema**: Map disparate data sources to a single property graph:
  - **Nodes**: `Entity` (Account/Wallet/Legal Entity), `SuperNode` (Exchanges/Hot Wallets/Omnibus).
  - **Edges**: `Transfer` (amount\_usd, timestamp, asset\_id, flow\_type).
- **Regulatory Gate**: Pre-graph screening against OFAC, FATF, and internal blocklists.

#### ### 3.2 Automated Analytics (Cypher Rule Engine)

- **Rule execution**: Daily batch run of openCypher templates:
  - **Circular Flow**: Detection of 2-5 hop cycles back to origin.
  - **Smurfing**: Aggregated layering of sub-\$10k transfers.
  - **Rapid Movement**: Money mule forwarding (>90% of incoming funds within window).
- **Alert Queue**: Persistence of hits into relational `alerts` table with priority scoring.

#### ### 3.3 Investigation Workspace (Frontend)

- **Unified Alert Dashboard**:
  - Prioritized queue of flagged entities and transactions.
  - State management (OPEN, UNDER\_REVIEW, CLOSED, ESCALATED).
- **Visual Graph Explorer**:
  - Dynamic expansion of node neighborhoods (up to 5 degree depth).
  - Contextual metadata overlays on nodes/edges.
  - Evidence export (graph screenshots/JSON).

---

### ## 4. Non-Functional Requirements

#### ### 4.1 Security & Compliance

- **Audit Logging**: Every read, expansion, or keyword search must be logged in the evidentiary audit trail.
- **RBAC**: Strict role separation (Viewer, Reviewer, Senior Investigator, Admin).
- **Data Privacy**: PII masking for unauthorized roles.

#### ### 4.2 Performance

- **Query Capping**: Enforce 30s timeout on Graph/Cypher traversals to prevent DB stall.
- **Super-Node Handling**: Automatically exclude designated `SuperNode` hubs from large-scale cycle detection.
- **Frontend Responsiveness**: Progressive loading of graph data to ensure smooth zooming/panning (<\$100ms UI interactions).

---

### ## 5. Deployment & Operations

- **Initialization**: Automated SQL scripts for PostgreSQL/AGE schema setup.
- **Monitoring**: Health endpoints for API and DB connection pool state.
- **DLQ**: Dead Letter Queue implementation for failed ETL rows.

## # Building unomi-did-vc standalone (TASK-031)

This repository copy does not contain the full Apache Unomi source tree, but the module builds standalone against published artifacts:

- the **ASF-published parent** `org.apache.unomi:unomi-root:3.1.0-SNAPSHOT` is checked in at the repository root as `pom.xml` (fetched from `repository.apache.org`; provides plugin/dependency management);
- `org.apache.unomi` snapshot dependencies (`unomi-api`, `unomi-bom`, `unomi-persistence-spi`, ...) resolve from the **Apache snapshot repository**, which `didvc/pom.xml` declares explicitly;
- `didvc/pom.xml` carries the module list so the reactor orders the seven modules correctly.

## ## Requirements

- JDK 17+ (verified with OpenJDK 25)
- Maven 3.9+
- Network access to `repo.maven.apache.org` and `repository.apache.org`

## ## Commands

````bash`

`# Run the test suite (surefire)`

`mvn -f didvc/pom.xml test`

`# Build all artifacts, including the didvc-edge Spring Boot fat jar`

`mvn -f didvc/pom.xml -DskipTests package`

`# Run a single module's tests`

`mvn -f didvc/pom.xml -pl didvc-sd-jwt test`

`````

## ## Verified results (2026-09-03, OpenJDK 25.0.4 / Maven 3.9.12)

| Check | Result |

| --- | --- |

| `mvn -f didvc/pom.xml test` | **\*\*BUILD SUCCESS** – 220 tests, 0 failures, 0 errors, 0 skipped\*\* (aggregated from surefire reports; README cites 217 – current tree carries 220) |

| `mvn -f didvc/pom.xml -DskipTests package` | **\*\*BUILD SUCCESS\*\*** – 7 artifacts, incl. `didvc-edge/target/unomi-did-vc-edge-3.1.0-SNAPSHOT.jar` (executable fat jar, ~50 MB) |

Note on timestamps: archive entry dates inside the jars are pinned to the ASF parent's reproducible-build `outputTimestamp` (2022-12-11) – the jars themselves are freshly compiled (manifest `Build-Jdk-Spec` and class bytes match the current build).

## ## Updating the root parent

The checked-in root `pom.xml` mirrors

`https://repository.apache.org/content/repositories/snapshots/org/apache/unomi/unomi-root/3.1.0-SNAPSHOT/` (fetch the latest timestamped `unomi-root-*.pom` from `maven-metadata.xml` to refresh it).
