

SOURCE CODE MASTER

AML / KYC Platform Reference

Version 1.2

Combined text-source listing of the Overwatch2 repository root: 427 files, 97,078 lines, 6.99 MB of text across 1707 pages.

Covers the AML platform (FastAPI backend, Next.js frontend, Apache AGE graph model), the Dagster ETL pipelines, the unified aml_detection engine, the unomi-did-vc DID/Verifiable-Credentials identity module (Java), and all specifications, implementation plans and working documents.

Generated 2026-09-03. Text is selectable and searchable; the PDF outline bookmarks every file, and the table of contents lists each file's start page.

Contents Summary

Group	Files	Lines	Size
(root files)	8	2,585	148 KB
.agents	2	18	1 KB
.github	1	29	1 KB
aml_detection	18	1,689	64 KB
aml_platform	113	32,549	3,693 KB
didvc	186	27,282	1,129 KB
docs	63	23,308	1,216 KB
etl	15	916	37 KB
Implementation_Plan	15	8,271	514 KB
input_data	1	131	10 KB
tmp	5	300	16 KB

Excluded (binary / generated / vendored): .git, node_modules, Maven target/, graphify-out, __pycache__, .venv, and PDF/DOCX/XLSX/PNG/JAR/SQLite artifacts.

graphify

This project has a graphify knowledge graph at graphify-out/.

Rules:

- Before answering architecture or codebase questions, read graphify-out/GRAPH_REPORT.md for god nodes and community structure
- If graphify-out/wiki/index.md exists, navigate it instead of reading raw files
- If the graphify MCP server is active, utilize tools like ``query_graph``, ``get_node``, and ``shortest_path`` for precise architecture navigation instead of falling back to ``grep``
- If the MCP server is not active, the CLI equivalents are ``graphify query "<question>"``, ``graphify path "<A>" "<B>"``, and ``graphify explain "<concept>"`` – prefer these over `grep` for cross-module questions
- After modifying code files in this session, run ``graphify update .`` to keep the graph current (AST-only, no API cost)

.agents/workflows/graphify.md

```
# Workflow: graphify
**Command:** /graphify
**Description:** Turn any folder of files into a navigable knowledge graph

## Steps
Follow the graphify skill installed at ~/.agents/skills/graphify/SKILL.md to run the full pipeline.

If no path argument is given, use `.` (current directory).
```

## aml\_detection/\_\_init\_\_.py

52 lines · 1.6 KB · page 19

```
"""
aml_detection – unified rail/currency-aware detection core.

One scenario registry + one execution engine that serves BOTH physical graphs
(`aml_network` and `tap_and_go_network`) via per-graph profiles. See
``docs/adr/0001-unified-detection-engine.md`` and §7 of
``Implementation_Plan/20260710_typology_gap_plan.md``.

IMPORT BOUNDARY (enforced by convention – review it):
 This package MUST NOT import ``dagster`` or ``psycpg2`` at module import
 time. Database connections and execution hosts are passed in by the caller,
 so the package is unit-testable and importable from BOTH the aml_platform
 venv AND the Dagster container.

Planned layout (filled by later plan phases):
 contract.py – enums + dataclasses (this phase: U1.2) [#18, done]
 currency.py – CurrencyResolver [U1.3]
 profiles/ – aml_network + tap_and_go GraphProfiles [U1.4]
 alerts.py – AlertSink (schema-qualified insert adapter) [U1.5]
 registry.py – canonical abstract scenario registry [U2.1]
 render.py – per-profile Cypher renderer [U2.2]
 engine.py – detect(profile, conn) execution [U3]
"""

## aml\_detection/alerts.py

68 lines · 2.7 KB · page 20

```
"""Alert sink adapter (plan U1.5).
```

```
Writes detection alerts to the profile's schema-qualified alert table,
adapting to the column-superset difference between the two sinks:
```

```
* ``ag_catalog.alerts`` (aml_network) – also has ``alert_type``, ``ml_typology``,
 ``window_start``/``window_end`` (from init-scripts/05-alert-schema-v5.sql).
* ``core.alerts`` (tap_and_go) – the v5-shaped subset (etl/sql/alerts_schema.sql).
```

```
The engine authors a superset row; the sink introspects the target table's
actual columns (information_schema) and inserts only those present, so schema
drift never breaks the insert. For unit tests, columns can be injected to
avoid a DB round-trip.

"""Currency-aware threshold resolution (plan U1.3 / ADR 0001 $Currency).
```

```
The unified registry authors thresholds that may differ by currency (the two
graphs use USD and HKD). ``CurrencyResolver`` picks the right value for a
profile's base currency.
```

```
Two strategies:
```

```
* **Per-currency (v1 default)** – thresholds are keyed by :class:`Currency`;
 the resolver returns the entry for the requested currency. Robust: no FX
 dependency, no in-query math.
* **FX fallback (reserved)** – if ``fx_rates`` are supplied and a currency is
 absent from the thresholds but the base currency (HKD) is present, the base
 amount is converted. ``fx_rates`` defaults empty, so this never triggers in
 v1; the interface is reserved for when an FX source exists.
```

```
"""Unified detection engine (plan U3 / ADR 0001).

`detect(profile, conn)` runs the canonical scenario registry against ONE
graph described by `profile`, using the passed-in DB-API `conn`. It:
* resolves per-currency thresholds (CurrencyResolver),
* gates scenarios on the profile's capabilities (skips with a guidance log),
* renders concrete Cypher per profile,
* sinks hits via the AlertSink (adapting to each table's columns),
* isolates per-rule failures (rollback + log + continue) and commits each
 rule's alerts independently so a later failure cannot drop earlier hits.

Import boundary: this module imports ONLY other aml_detection modules (no
dagster / psycpg2). The connection is supplied by the caller – aml_platform's
rule_engine or the Dagster op – so the engine is unit-testable with a fake conn.

"""Canonical abstract scenario registry (plan U2.1 / ADR 0001 §7.3).
```

```
Merges the 7 aml_network scenarios (aml_platform/etl/scenarios.py) and the
3 Cypher tap_and_go scenarios (etl/detection.py) into ONE abstract registry,
deduplicating the overlaps (Circular, Structuring, Rapid Movement).
```

```
Abstract queries use ``<token>`` placeholders for profile-specific names
(account/transfer labels, value/ts/ref properties, graph name, party labels).
``aml_detection.render.render()`` substitutes them per profile. Monetary
thresholds are per-currency (resolved by CurrencyResolver); structural params
(hops, ratios, windows) are flat canonical defaults.
```

```
SCOPE NOTE – ``TG_SCN_VELOCITY_BURST_01`` (the tap_and_go SQL window rule) is
NOT ported here: it is a SQL rule over ``core.transactions`` with no aml_network
equivalent and doesn't fit the abstract-Cypher model. It remains in
etl/detection.py until the engine grows SQL-rule support (tracked in plan U7).

## aml\_detection/test\_render.py

208 lines · 8.7 KB · page 47

```
"""
Render snapshot + property tests (plan U6.3 – the critical de-risking suite).

Locks the concrete Cypher each profile gets for every scenario. This is where
the AGE label-union assumption (`Customer|Counterparty|Merchant`,
`PAID|TRANSFERRED`) is proven at the string level: if a profile's labels or
properties drift, or a token is left unresolved, a snapshot fails.

NOTE: these prove the RENDERED STRING is correct and well-formed. Whether AGE
actually accepts label-unions in variable-length relationships
(`[PAID|TRANSFERRED*2..5]`) still needs a live AGE check – see ADR 0001
risks and plan U7.2 verification. If AGE rejects multi-label variable paths,
the fallback is per-label UNION queries (renderer change only).

Run: python aml_detection/test_render.py
or: pytest aml_detection/test_render.py
"""

```
=====
Overwatch AML Platform – environment template (TASK-001 / TASK-002)
#
Copy to `.env` (next to docker-compose.yml) and fill in real values.
NEVER commit the real .env – it is gitignored.
#
Secrets: generate with `openssl rand -hex 32` and use ALPHANUMERIC values
only (some init scripts embed passwords into generated SQL).
#
Note: DATABASE_URL is assembled by docker-compose.yml from these values –
do not define DATABASE_URL in .env (compose interpolation does not expand
variables inside .env itself).
=====

--- PostgreSQL (age_db container) ---
POSTGRES_USER=postgres
POSTGRES_PASSWORD=REPLACE_WITH_RANDOM_HEX
POSTGRES_DB=age_prod_01

Application DB roles (created by init_scripts/00-roles-from-env.sh on first boot)
AML_API_PASSWORD=REPLACE_WITH_RANDOM_HEX
AML_ETL_PASSWORD=REPLACE_WITH_RANDOM_HEX

--- Backend authentication (TASK-002) ---
keycloak = production default: RS256 tokens validated against the realm JWKS.
local = development/tests: HS256 tokens signed with JWT_SECRET_KEY
(required, >= 32 chars, weak values rejected at startup).
AUTH_MODE=keycloak

Only needed when AUTH_MODE=local
JWT_SECRET_KEY=REPLACE_WITH_RANDOM_HEX_MIN_32_CHARS
ACCESS_TOKEN_EXPIRE_MINUTES=60

--- Keycloak ---
KEYCLOAK_URL=http://keycloak:8080
KEYCLOAK_REALM=aml

Authentication & authorization (TASK-001 / TASK-002).

Security model:
* AUTH_MODE=keycloak (default) – Keycloak-issued RS256 access tokens are
 validated against the realm JWKS with issuer, expiry and audience checks
 (see app.core.keycloak_auth). This is the production path.
* AUTH_MODE=local – HS256 tokens signed with the JWT_SECRET_KEY environment
 variable (required, min 32 chars, weak values rejected). Development and
 test path only.

There is deliberately NO unauthenticated fallback: a request without a valid
Bearer token is rejected with 401 (the former hardcoded anonymous-admin
bypass has been removed).

127 lines · 4.7 KB · page 72

```
"""
Keycloak access-token validation (TASK-002).

Validates Keycloak-issued JWTs the way a relying party should:
* RS256 signature verified against the realm JWKS (cached, PyJWKClient)
* issuer (`iss`) must equal the configured realm issuer
* expiry (`exp`) and not-before (`nbf`) enforced, with configurable leeway
* audience (`aud`) / authorized-party (`azp`) must match the expected client
* realm roles are mapped onto platform roles (aml_admin -> ADMIN, ...)

The validator fails closed: any error (network, unknown `kid`, bad signature,
expired token, wrong issuer/audience) results in an authentication failure.
"""

```
"""
Public audit API (TASK-004).

Wraps app.services.audit_store with the logger mirror, actor resolution and
input normalisation. Design rules:

* record_audit_event() NEVER raises – an audit failure must not break the
 audited request; every event is mirrored to the `aml_audit` logger so a
 log-file trail survives database outages.
* All values are normalised to typed parameters before reaching SQL; string
 identifiers that are not UUIDs travel inside the `reason` text.
"""

```

```
Apache AGE graph queries (TASK-003 hardening).
```

```
Constraint: with asyncpg, a Cypher query must be passed to cypher() as one
dollar-quoted SQL string, so bind parameters ($1, $2, ...) cannot be placed
inside the Cypher body. Injection is therefore prevented by construction:
```

1. `limit` and `depth` are coerced to int and clamped server-side – they can only ever render as bounded integer literals.
2. `entity\_id` must pass a strict allowlist (`validate_entity_id`): a short, fixed charset and a hard length cap. Values that could terminate the dollar-quoted block or quote out of a string (quotes, backslashes, dollar signs, semicolons, whitespace, unicode) are rejected outright.
3. As defence-in-depth the id is additionally escaped (`escape_cypher_string`) before embedding.

```
Every query in this module builds its Cypher body exclusively from these
validated values.
```

```
"""

## # Overwatch AML Platform – Backend

FastAPI backend for the Overwatch AML platform (fiat + stablecoin transaction monitoring, alert/case/STR workflow) over PostgreSQL + Apache AGE.

### ## Security configuration (P0 hardening – TASK-001/002/004)

The application **refuses to start** when required secrets are missing or weak. All credentials come exclusively from environment variables – there are no fallback literals in the codebase.

#### ### Authentication modes (`AUTH\_MODE`)

Mode	Use	Mechanism
`keycloak` (default)	Production	Keycloak-issued RS256 access tokens validated against the realm JWKS – signature, issuer (`iss`), expiry (`exp`/`nbf`) and audience (`aud`/`azp`) are all enforced (fail closed). Realm roles map to platform roles: `aml_admin` → ADMIN, `aml_department_head` → DEPARTMENT_HEAD, `aml_senior_investigator` → SENIOR_INVESTIGATOR, `aml_analyst` → JUNIOR_ANALYST.
`local`	Development / tests	HS256 tokens signed with `JWT_SECRET_KEY` (required, ≥ 32 chars, known-weak values rejected) against the `public.users` table.

There is **no unauthenticated fallback** – requests without a valid Bearer token are rejected with 401 (the former anonymous-admin bypass was removed as part of TASK-002).

`POST /api/v1/auth/login`:

- `keycloak` mode: proxies the resource-owner password grant to Keycloak and returns the Keycloak-issued token.
- `local` mode: verifies credentials locally and issues an HS256 token.

#### ### Environment variables

Variable	Required	Notes
`DATABASE_URL`	always	PostgreSQL DSN, e.g. `postgresql://aml_api_role:<password>@age_db:5432/age_prod_01`. No default.
`AUTH_MODE`	no	`keycloak` (default) or `local`.
`JWT_SECRET_KEY`	when `AUTH_MODE=local`	≥ 32 chars; weak/revoked values rejected at startup. Generate: `openssl rand -hex 32`.
`ACCESS_TOKEN_EXPIRE_MINUTES`	no	Default 60 (local mode only).
`KEYCLOAK_URL`	when `AUTH_MODE=keycloak`	e.g. `http://keycloak:8080`.
`KEYCLOAK_REALM`	no	Default `aml`.
`KEYCLOAK_AUDIENCE`	no	Expected `aud`/`azp` client; default `aml-portal`.
`KEYCLOAK_LEEWAY_SECONDS`	no	Clock-skew leeway; default 30.
`KEYCLOAK_ADMIN_USER` / `KEYCLOAK_ADMIN_PASSWORD`		for provisioning endpoints only   Admin client for `/api/v1/admin/*`; no defaults.

See `../.env.example` for a complete template.

#### ### Graph query hardening (TASK-003)

Apache AGE requires the Cypher body as a single dollar-quoted SQL string, so bind parameters cannot appear inside it. `app/services/graph\_service.py` therefore prevents injection by construction:

1. `limit` / `depth` are coerced to `int` and clamped (`1..500`, `1..6`) – they can only render as bounded integer literals.
2. Entity ids must match `[A-Za-z0-9.\_@-]{1,128}` (`validate\_entity\_id`) – quotes, dollar signs, semicolons, whitespace and unicode are rejected with HTTP 400 before any query is built.
3. Defence-in-depth: ids are additionally escaped (`escape\_cypher\_string`) before embedding.

All relational queries throughout the API use asyncpg `\$n` bind parameters.

#### ### Audit trail (TASK-004)

Every user action (logins, alert triage actions, graph exploration, PII unmasking, user provisioning, role assignment, STR updates) is persisted to `app.audit\_access\_events` – an **append-only** table (UPDATE/DELETE blocked by trigger) with a **SHA-256 hash chain** computed by the database triggers in `init\_scripts/02\_audit\_tamper\_evidence.sql`. Events are mirrored to the `aml\_audit` logger so a trail survives DB outages; audit failures never break the audited request.

Admin-only endpoints:

- `GET /api/v1/audit/export?since=&until=&limit=` – NDJSON export for SIEM ingestion.
- `GET /api/v1/audit/verify` – recomputes the hash chain in SQL and reports integrity (`{valid, checked, broken\_records, broken\_at}`).

#### ## Deployment

```
``bash
cd aml_platform
```

```
cp .env.example .env # fill in real values (openssl rand -hex 32)
docker compose up -d --build
````
```

First boot: ``00-roles-from-env.sh`` creates the DB roles from the environment; Keycloak imports ``keycloak/aml-realm.json`` (realm ``aml``, client ``aml-portal``, realm roles). Create the first realm user in the Keycloak console (master admin comes from ``KEYCLOAK_ADMIN_*`) and assign the appropriate ``aml_*` realm role, then sign in through the portal login page.

> Existing volumes initialised with the old literal credentials must be recreated (``docker compose down -v``) before the environment-sourced credentials work.

Running tests

```
``bash
cd backend
uv venv .venv && uv pip install -r requirements.txt pytest-asyncio # or pip
pytest tests/ -v
````
```

Tests cover: fail-fast security config, token validation (local + Keycloak RS256 with issuer/expiry/audience enforcement), graph-input allowlist (injection payloads rejected), and audit persistence semantics.

## aml\_platform/build\_log.txt

649 lines · 41.8 KB · page 189

```
time="2026-04-03T19:18:53+08:00" level=warning msg="Z:\\GITHUB\\Overwatch\\aml_platform\\docker-compose.yml: the attribute `version` is obsolete, it will be ignored, please remove it to avoid potential confusion"
Compose can now delegate builds to bake for better performance.
To do so, set COMPOSE_BAKE=true.
